---

---

---

### Vision talk : Han Joo from CMU

- Tuesday, 11 am in this room
- Social Signal Processing: A Computational Approach to Sensing, Reconstructing and Understanding Social Interaction

---

---

---

---

---

---

---

---

### Last time

- Discovering visual patterns
  - Randomized hashing algorithms
  - Mining large-scale image collections

---

---

---

---

---

---

---

---

## Review questions

- What kind of input data is searchable with min-hash hashing?
- What kind of input data is searchable with LSH using random projections?
- For Visual "PageRank" what do weights between nodes (images) signify?

---

---

---

---

---

---

---

---

## Next

- Supervised classification
- Window-based generic object detection
  - basic pipeline
  - boosting classifiers
  - face detection as case study

---

---

---

---

---

---

---

---

## Probability refresher

### Basic probability

- $X$  is a random variable
- $P(X)$  is the probability that  $X$  achieves a certain value

- $0 \leq P(X) \leq 1$
- $\int_{-\infty}^{\infty} P(X) dX = 1$  or  $\sum P(X) = 1$   
 continuous  $X$                       discrete  $X$
- Conditional probability:  $P(X | Y)$   
 – probability of  $X$  given that we already know  $Y$

Source: Steve Seitz

---

---

---

---

---

---

---

---

### Supervised classification

- Given a collection of *labeled* examples, come up with a function that will predict the labels of new examples.

"four" 

"nine" 

Training examples

?

Novel input

- How good is some function we come up with to do the classification?
- Depends on
  - Mistakes made
  - Cost associated with the mistakes

---

---

---

---

---

---

---

---

### Supervised classification

- Given a collection of *labeled* examples, come up with a function that will predict the labels of new examples.
- Consider the two-class (binary) decision problem
  - $L(4 \rightarrow 9)$ : Loss of classifying a 4 as a 9
  - $L(9 \rightarrow 4)$ : Loss of classifying a 9 as a 4
- Risk** of a classifier  $s$  is expected loss:  

$$R(s) = \Pr(4 \rightarrow 9 | \text{using } s)L(4 \rightarrow 9) + \Pr(9 \rightarrow 4 | \text{using } s)L(9 \rightarrow 4)$$
- We want to choose a classifier so as to minimize this total risk

---

---

---

---

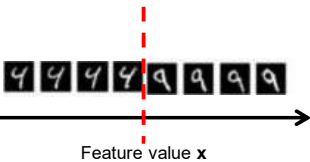

---

---

---

---

### Supervised classification

Optimal classifier will minimize total risk.

At decision boundary, either choice of label yields same expected loss.

If we choose class "four" at boundary, expected loss is:  

$$= P(\text{class is } 9 | x) L(9 \rightarrow 4) + P(\text{class is } 4 | x) L(4 \rightarrow 4)$$

If we choose class "nine" at boundary, expected loss is:  

$$= P(\text{class is } 4 | x) L(4 \rightarrow 9)$$

---

---

---

---

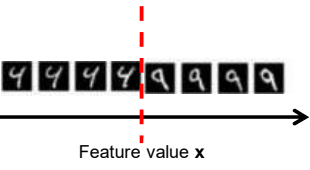

---

---

---

---

### Supervised classification

Optimal classifier will minimize total risk.

At decision boundary, either choice of label yields same expected loss.

So, best decision boundary is at point  $x$  where

$$P(\text{class is } 9 | x) L(9 \rightarrow 4) = P(\text{class is } 4 | x) L(4 \rightarrow 9)$$

To classify a new point, choose class with lowest expected loss; i.e., choose "four" if

$$P(4 | x) L(4 \rightarrow 9) > P(9 | x) L(9 \rightarrow 4)$$

---

---

---

---

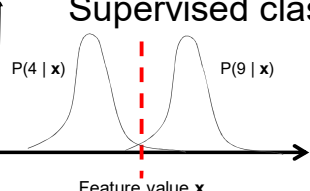

---

---

---

---

### Supervised classification

Optimal classifier will minimize total risk.

At decision boundary, either choice of label yields same expected loss.

So, best decision boundary is at point  $x$  where

$$P(\text{class is } 9 | x) L(9 \rightarrow 4) = P(\text{class is } 4 | x) L(4 \rightarrow 9)$$

To classify a new point, choose class with lowest expected loss; i.e., choose "four" if

$$P(4 | x) L(4 \rightarrow 9) > P(9 | x) L(9 \rightarrow 4)$$

---

---

---

---

---

---

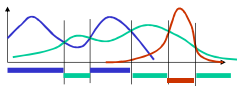

---

---

### General classification

This same procedure applies in more general circumstances

- More than two classes
- More than one dimension

Example: face detection

- Here,  $X$  is an image region
  - dimension = # pixels
  - each face can be thought of as a point in a high dimensional space

H. Schneiderman, T. Kanade, "A Statistical Method for 3D Object Detection Applied to Faces and Cars", IEEE Conference on Computer Vision and Pattern Recognition (CVPR 2006) <http://www2.eecs.berkeley.edu/teach/cvpr06.pdf>

## Today

- Supervised classification
- **Window-based generic object detection**
  - basic pipeline
  - boosting classifiers
  - face detection as case study

---

---

---

---

---

---

---

---

## Generic category recognition: basic framework

- Build/train object model
  - Choose a representation
  - Learn or fit parameters of model / classifier
- Generate candidates in new image
- Score the candidates

---

---

---

---

---

---

---

---

## Window-based models Building an object model

Given the representation, train a binary classifier

Slide: Kristen Grauman

---

---

---

---

---

---

---

---

### Window-based models

#### Generating and scoring candidates

The diagram shows a street scene with a yellow rectangular window highlighting a car. An arrow points from this window to a box labeled "Car/non-car Classifier".

Slide: Kristen Grauman

---

---

---

---

---

---

---

---

### Window-based object detection: recap

**Training:**

1. Obtain training data
2. Define features
3. Define classifier

**Given new image:**

1. Slide window
2. Score by classifier

The diagram illustrates the object detection process. It starts with "Training examples" which are used to train a "Feature extraction" model. This model then takes a "Given new image" with a yellow window and outputs a score to a "Car/non-car Classifier".

---

## Boosting: training

- Initially, weight each training example equally
- In each boosting round:
  - Find the weak learner that achieves the lowest *weighted* training error
  - Raise weights of training examples misclassified by current weak learner
- Compute final classifier as linear combination of all weak learners (weight of each learner is directly proportional to its accuracy)
- Exact formulas for re-weighting and combining weak learners depend on the particular boosting scheme (e.g., AdaBoost)

#### Abstract

*This paper describes a machine learning approach for vi-*

*ected at 15 frames per second on a conventional 700 MHz Intel Pentium III. In other face detection systems, auxiliary information, such as image differences in video sequences,*

---

---

---

---

---

---

---

---

## Viola-Jones face detector

### Main idea:

- Represent local texture with efficiently computable “rectangular” features within window of interest
- Select discriminative features to be weak classifiers
- Use boosted combination of them as final classifier
- Form a cascade of such classifiers, rejecting clear negatives quickly

---

---

---

---

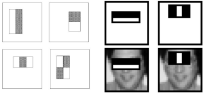

---

---

---

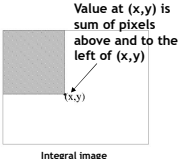

---

### Viola-Jones detector: features

**"Rectangular" filters**  
 Feature output is difference between adjacent regions

Efficiently computable with integral image: any sum can be computed in constant time.

Value at (x,y) is sum of pixels above and to the left of (x,y)

Integral image

Slide: Kristen Grauman

---

---

---

---

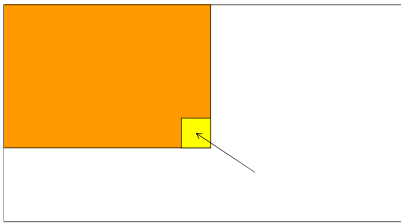

---

---

---

---

### Computing the integral image

Lana Lazebnik

---

---

---

---

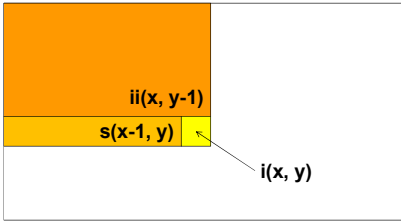

---

---

---

---

### Computing the integral image

Cumulative row sum:  $s(x, y) = s(x-1, y) + i(x, y)$   
 Integral image:  $ii(x, y) = ii(x, y-1) + s(x, y)$

Lana Lazebnik

---

---

---

---

---

---

---

---

### Computing sum within a rectangle

- Let A,B,C,D be the values of the integral image at the corners of a rectangle
- Then the sum of original image values within the rectangle can be computed as:  

$$\text{sum} = A - B - C + D$$
- Only 3 additions are required for any size of rectangle!

Lana Lazebnik

---

---

---

---

---

---

---

---

### Viola-Jones detector: features

#### "Rectangular" filters

Feature output is difference between adjacent regions

Efficiently computable with integral image: any sum can be computed in constant time

Avoid scaling images → scale features directly for same cost

---

---

---

---

---

---

---

---

### Viola-Jones detector: features

Considering all possible filter parameters: position, scale, and type:

180,000+ possible features associated with each 24 x 24 window

*Which subset of these features should we use to determine if a window has a face?*

**Use AdaBoost both to select the informative features and to form the classifier**

---

---

---

---

---

---

---

---

### Viola-Jones detector: AdaBoost

- Want to select the single rectangle feature and threshold that best separates **positive** (faces) and **negative** (non-faces) training examples, in terms of **weighted error**.

Outputs of a possible rectangle feature on faces and non-faces.

**Resulting weak classifier:**

$$h_t(x) = \begin{cases} +1 & \text{if } f_t(x) > \theta_t \\ -1 & \text{otherwise} \end{cases}$$

For next round, reweight the examples according to errors, choose another filter/threshold combo.

Slide: Kristen Grauman

---

---

---

---

---

---

---

---

---

---

---

---

### AdaBoost Algorithm

- Given example images  $(x_1, y_1), \dots, (x_n, y_n)$  where  $y_i = 0, 1$  for negative and positive examples respectively.
- Initialize weights  $w_{1,j} = \frac{1}{2m}, \frac{1}{2l}$  for  $y_i = 0, 1$  respectively, where  $m$  and  $l$  are the number of negatives and positives respectively.
- For  $t = 1, \dots, T$ :
  - Normalize the weights,
 
$$w_{t,j} \leftarrow \frac{w_{t,j}}{\sum_{j=1}^n w_{t,j}}$$
 so that  $w_{t,j}$  is a probability distribution.
  - For each feature,  $j$ , train a classifier  $h_j$  which is restricted to using a single feature. The error is evaluated with respect to  $w_{t,j}$ ,  $e_j = \sum_i w_{t,j} |h_j(x_i) - y_i|$ .
  - Choose the classifier,  $h_t$ , with the lowest error  $e_t$ .
  - Update the weights:
 
$$w_{t+1,j} = w_{t,j} \beta^{1 - e_j}$$
 where  $e_j = 0$  if example  $x_i$  is classified correctly,  $e_j = 1$  otherwise, and  $\beta_j = \frac{1 - e_j}{1 + e_j}$ .
- The final strong classifier is:
 
$$h(x) = \begin{cases} 1 & \sum_{t=1}^T \alpha_t h_t(x) \geq \frac{1}{2} \sum_{t=1}^T \alpha_t \\ 0 & \text{otherwise} \end{cases}$$
 where  $\alpha_t = \log \frac{1}{\beta_t}$ .

Start with uniform weights on training examples

For T rounds

- Evaluate **weighted error** for each feature, pick best.
- Re-weight the examples:
  - Incorrectly classified -> more weight
  - Correctly classified -> less weight

Final classifier is combination of the weak ones, weighted according to error they had.

**Freund & Schapire 1995**

---

---

---

---

### Viola-Jones Face Detector: Results

First two features selected

Visual Object Recognition Tutorial

---

---

---

---

---

---

---

---

---

---

---

---

- Even if the filters are fast to compute, each new image has a lot of possible windows to search.
- How to make the detection more efficient?

---

---

---

---

---

---

---

---

### Cascading classifiers for detection

```

    graph LR
      A[All sub-windows, multiple scales] --> B((Stage 1 classifier))
      B -- Face --> C((Stage 2 classifier))
      B -- Non-face --> D[Rejected sub-windows]
      C -- Face --> E((Stage 3 classifier))
      C -- Non-face --> D
      E -- Face --> F[Detection at a sub-window]
      E -- Non-face --> D
      A -- "More features, lower false positive rates" --> E
  
```

- Form a *cascade* with low false negative rates early on
- Apply less accurate but faster classifiers first to immediately discard windows that clearly appear to be negative

Slide: Kristen Grauman

---

---

---

---

---

---

---

---

### Training the cascade

- Set target detection and false positive rates for each stage
- Keep adding features to the current stage until its target rates have been met
  - Need to lower AdaBoost threshold to maximize detection (as opposed to minimizing total classification error)
  - Test on a *validation set*
- If the overall false positive rate is not low enough, then add another stage
- Use false positives from current stage as the negative training examples for the next stage

---

---

---

---

---

---

---

---

### Viola-Jones detector: summary

Train with 5K positives, 350M negatives  
 Real-time detector using 38 layer cascade  
 6061 features in all layers

[Implementation available in OpenCV]  
 Slide: Kristen Grauman

---

---

---

---

---

---

---

---

---

---

---

---

### Viola-Jones detector: summary

- A seminal approach to real-time object detection
  - 15,700 citations and counting
- Training is slow, but detection is very fast
- Key ideas
  - *Integral images* for fast feature evaluation
  - *Boosting* for feature selection
  - *Attentional cascade* of classifiers for fast rejection of non-face windows

**Google now erases faces, license plates on Map Street View**

By Elnor Wai, CNET News.com  
Friday, August 24, 2007 9:32 PM

Google has gotten a lot of flack from privacy advocates for photographing faces and license plate numbers and displaying them on the Street View in Google Maps. Originally, the company said only people who identified themselves could ask the company to remove their image.

But Google has quietly changed that policy, partly in response to criticism, and now anyone can alert the company and have an image of a license plate or a recognizable face removed, not just the owner of the face or car, says Marissa Mayer, vice president of search products and user experience at Google.

"It's a good policy for users and also clarified the intent of the product," she said in an interview following her keynote at the Search Engine Strategies conference in San Jose, Calif., Wednesday.

The policy change was made about 10 days after the launch of the product in late May, but was not publicly announced, according to Mayer. The company is removing images only when someone notifies them and not proactively, she said. "It was definitely a big policy change inside."

### Boosting: pros and cons

- Advantages of boosting
  - Integrates classification with feature selection
  - Complexity of training is linear in the number of training examples
  - Flexibility in the choice of weak learners, boosting scheme
  - Testing is fast
  - Easy to implement
- Disadvantages
  - Needs many training examples
  - Other discriminative models may outperform in practice (SVMs, CNNs,...)
    - especially for many-class problems

Slide credit: Lana Lazebnik

---

---

---

---

---

---

---

---

### Window-based detection: strengths

- Sliding window detection and global appearance descriptors:
  - > Simple detection protocol to implement
  - > Good feature choices critical
  - > Past successes for certain classes

Slide: Kristen Grauman

Visual Object Recognition Tutorial

---

---

---

---

---

---

---

---

### Window-based detection: Limitations

- High computational complexity
  - > For example: 250,000 locations x 30 orientations x 4 scales = 30,000,000 evaluations!
  - > If training binary detectors independently, means cost increases linearly with number of classes
- With so many windows, false positive rate better be low

Slide: Kristen Grauman
