

Image gradients and edges

Thurs Jan 25, 2018
Kristen Grauman
UT-Austin

Reminders

- Piazza for assignment help
- Office hours on homepage
- Reminder: no laptops, phones, tablets, etc. open in class.

Last time

- Various models for image “noise”
- Linear filters and convolution useful for
 - Image smoothing, removing noise
 - Box filter
 - Gaussian filter
 - Impact of scale / width of smoothing filter
- Separable filters more efficient
- Median filter: a non-linear filter, edge-preserving

Review

Filter $f = 1/9 \times [1\ 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1]$

original image h filtered

Review

Filter $f = 1/9 \times [1\ 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1]^T$

original image h filtered

Image filtering

- Compute a function of the local neighborhood at each pixel in the image
 - Function specified by a “filter” or mask saying how to combine values from neighbors.
- Uses of filtering:
 - Enhance an image (denoise, resize, etc)
 - Extract information (texture, edges, etc)
 - Detect patterns (template matching)

Today

Adapted from Derek Hoiem

Edge detection

- **Goal:** map image from 2d array of pixels to a set of curves or line segments or contours.
- **Why?**

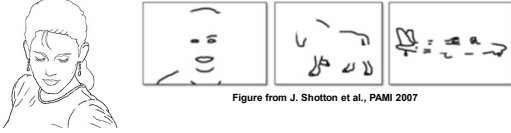

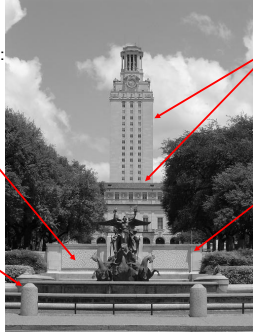

Figure from J. Shotton et al., PAMI 2007

- **Main idea:** look for strong gradients, post-process

What causes an edge?

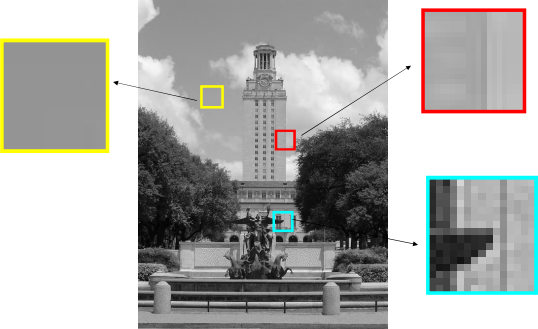

Reflectance change: appearance information, texture

Change in surface orientation: shape

Depth discontinuity: object boundary

Cast shadows

Edges/gradients and invariance

Derivatives and edges

An edge is a place of rapid change in the image intensity function.

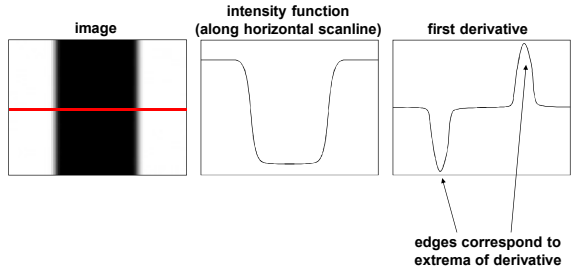

image intensity function (along horizontal scanline) first derivative

edges correspond to extrema of derivative

Source: I. Lazebnik

Derivatives with convolution

For 2D function, $f(x,y)$, the partial derivative is:

$$\frac{\partial f(x,y)}{\partial x} = \lim_{\epsilon \rightarrow 0} \frac{f(x+\epsilon,y) - f(x,y)}{\epsilon}$$

For discrete data, we can approximate using finite differences:

$$\frac{\partial f(x,y)}{\partial x} \approx \frac{f(x+1,y) - f(x,y)}{1}$$

To implement above as convolution, what would be the associated filter?

Partial derivatives of an image

$\frac{\partial f(x,y)}{\partial x}$ $\frac{\partial f(x,y)}{\partial y}$

-1 1 -1 1
1 ? or -1

Which shows changes with respect to x?
(showing filters for correlation)

Assorted finite difference filters

Prewitt: $M_x = \begin{bmatrix} -1 & 0 & 1 \\ -1 & 0 & 1 \\ -1 & 0 & 1 \end{bmatrix}$; $M_y = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & 0 \\ -1 & -1 & -1 \end{bmatrix}$

Sobel: $M_x = \begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix}$; $M_y = \begin{bmatrix} 1 & 2 & 1 \\ 0 & 0 & 0 \\ -1 & -2 & -1 \end{bmatrix}$

Roberts: $M_x = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}$; $M_y = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$

```
>> My = fspecial('sobel');
>> outim = imfilter(double(im), My);
>> imagesc(outim);
>> colormap gray;
```

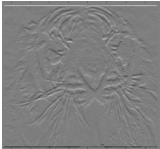

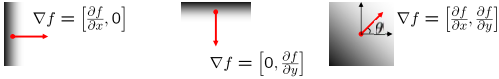

Image gradient

The gradient of an image:

$$\nabla f = \left[\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$$

The gradient points in the direction of most rapid change in intensity

The **gradient direction** (orientation of edge normal) is given by:

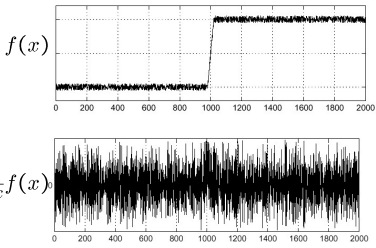

$$\theta = \tan^{-1} \left(\frac{\partial f / \partial y}{\partial f / \partial x} \right)$$

Slide credit: Steve Seitz

Effects of noise

Consider a single row or column of the image

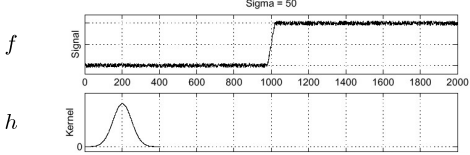

- Plotting intensity as a function of position gives a signal

Where is the edge?

Slide credit: Steve Seitz

Solution: smooth first

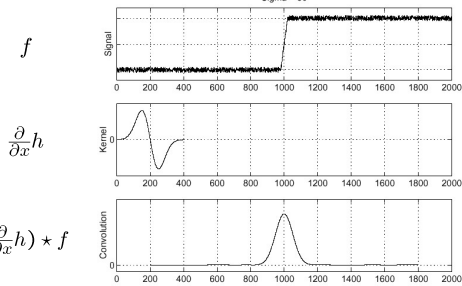

Where is the edge? Look for peaks in $\frac{\partial}{\partial x}(h * f)$

Derivative theorem of convolution

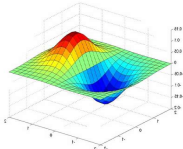

$$\frac{\partial}{\partial x}(h * f) = \left(\frac{\partial}{\partial x} h \right) * f$$

Differentiation property of convolution.

Slide credit: Steve Seitz

Derivative of Gaussian filters

$$(I \otimes g) \otimes h = I \otimes (g \otimes h)$$

Derivative of Gaussian filters

x-direction **y-direction**

Source: L. Lazebnik

Laplacian of Gaussian

Consider $\frac{\partial^2}{\partial x^2}(h \star f)$

Where is the edge? Zero-crossings of bottom graph

Slide credit: Steve Seitz

2D edge detection filters

Gaussian **derivative of Gaussian** **Laplacian of Gaussian**

$$h_\sigma(u, v) = \frac{1}{2\pi\sigma^2} e^{-\frac{u^2+v^2}{2\sigma^2}}$$

$$\frac{\partial}{\partial x} h_\sigma(u, v) \quad \nabla^2 h_\sigma(u, v)$$

- ∇^2 is the Laplacian operator:

$$\nabla^2 f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2}$$

Slide credit: Steve Seitz

Smoothing with a Gaussian

Recall: parameter σ is the "scale" / "width" / "spread" of the Gaussian kernel, and controls the amount of smoothing.

Effect of σ on derivatives

$\sigma = 1$ pixel $\sigma = 3$ pixels

The apparent structures differ depending on Gaussian's scale parameter.

Larger values: larger scale edges detected
Smaller values: finer features detected

So, what scale to choose?

It depends what we're looking for.

Mask properties

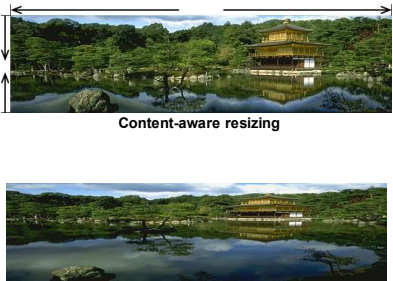

- Smoothing
 - Values positive
 - Sum to 1 → constant regions same as input
 - Amount of smoothing proportional to mask size
 - Remove "high-frequency" components; "low-pass" filter
- Derivatives
 - _____ signs used to get high response in regions of high contrast
 - Sum to ____ → no response in constant regions
 - High absolute value at points of high contrast

Seam carving: main idea

[Shai & Avidan, SIGGRAPH 2007]

Seam carving: main idea

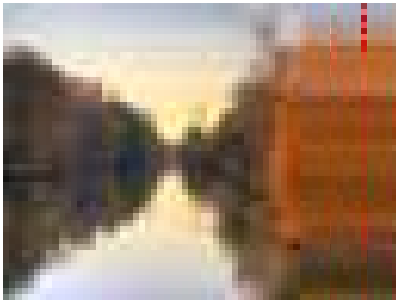

[Shai & Avidan, SIGGRAPH 2007]

Seam carving: main idea

Real image example

Seam carving: main idea

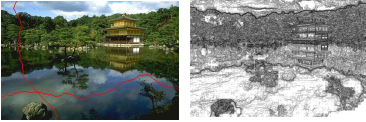

Content-aware resizing

Intuition:

- Preserve the most "interesting" content
 - Prefer to remove pixels with low gradient energy
- To reduce or increase size in one dimension, remove irregularly shaped "seams"
 - Optimal solution via dynamic programming.

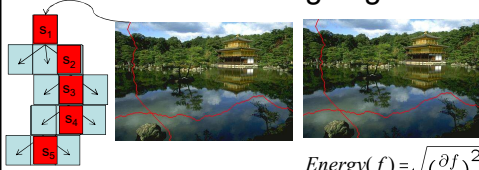

Seam carving: main idea

$$Energy(f) = \sqrt{\left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2}$$

- Want to remove seams where they won't be very noticeable:
 - Measure "energy" as gradient magnitude
- Choose seam based on **minimum total energy path** across image, subject to 8-connectedness.

Seam carving: algorithm

$$Energy(f) = \sqrt{\left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2}$$

Let a **vertical seam** s consist of h positions that form an 8-connected path.

Let the **cost of a seam** be: $Cost(s) = \sum_{i=1}^h Energy(f(s_i))$

Optimal seam minimizes this cost: $s^* = \min_s Cost(s)$

Compute it efficiently with **dynamic programming**.

How to identify the minimum cost seam?

- First, consider a **greedy** approach:

1	3	0
2	8	9
5	2	6

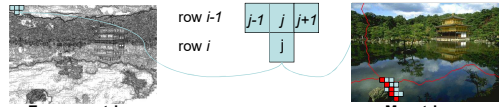

Energy matrix (gradient magnitude)

Seam carving: algorithm

- Compute the **cumulative minimum energy** for all possible connected seams at each entry (i,j) :

$$M(i, j) = Energy(i, j) + \min(M(i-1, j-1), M(i-1, j), M(i-1, j+1))$$

Energy matrix (gradient magnitude)

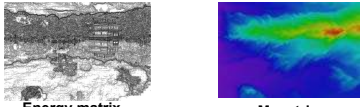

M matrix: cumulative min energy (for vertical seams)

- Then, min value in last row of M indicates end of the minimal connected vertical seam.
- Backtrack up from there, selecting min of 3 above in M .

Example

$$M(i, j) = Energy(i, j) + \min(M(i-1, j-1), M(i-1, j), M(i-1, j+1))$$

1	3	0
2	8	9
5	2	6

Energy matrix (gradient magnitude)

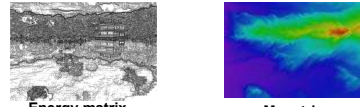

M matrix (for vertical seams)

Example

$$M(i, j) = Energy(i, j) + \min(M(i-1, j-1), M(i-1, j), M(i-1, j+1))$$

1	3	0
2	8	9
5	2	6

1	3	0
3	8	9
8	5	14

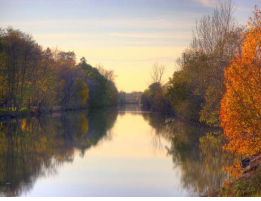

Energy matrix (gradient magnitude)

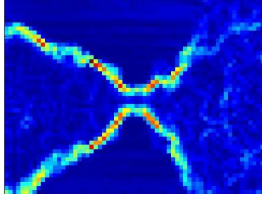

M matrix (for vertical seams)

Real image example

Original Image

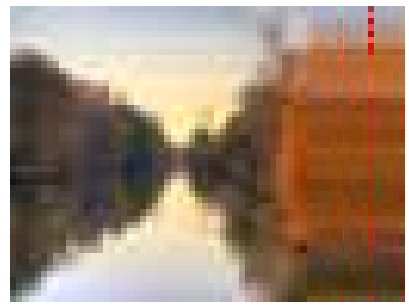

Energy Map

Blue = low energy
Red = high energy

Real image example

Other notes on seam carving

- Analogous procedure for horizontal seams
- Can also insert seams to *increase* size of image in either dimension
 - Duplicate optimal seam, averaged with neighbors
- Other energy functions may be plugged in
 - E.g., color-based, interactive,...
- Can use combination of vertical and horizontal seams

Gradients -> edges

Primary edge detection steps:

1. Smoothing: suppress noise
2. Edge enhancement: filter for contrast
3. Edge localization

Determine which local maxima from filter output are actually edges vs. noise

- Threshold, Thin

This block contains a list of primary edge detection steps and a note on determining local maxima. It also includes a small image of a butterfly and its corresponding edge detection result.

Thresholding

- Choose a threshold value t
- Set any pixels less than t to zero (off)
- Set any pixels greater than or equal to t to one (on)

Original image

Gradient magnitude image

Thresholding gradient with a lower threshold

Thresholding gradient with a higher threshold

Canny edge detector

- Filter image with derivative of Gaussian
- Find magnitude and orientation of gradient
- **Non-maximum suppression:**
 - Thin wide “ridges” down to single pixel width
- **Linking and thresholding (hysteresis):**
 - Define two thresholds: low and high
 - Use the high threshold to start edge curves and the low threshold to continue them
- MATLAB: `edge(image, 'canny');`
- `>>help edge`

The Canny edge detector

norm of the gradient

The Canny edge detector

thresholding

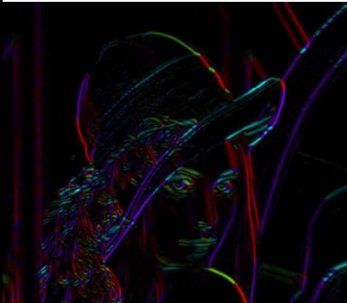

The Canny edge detector

How to turn these thick regions of the gradient into curves?

Get Orientation at Each Pixel

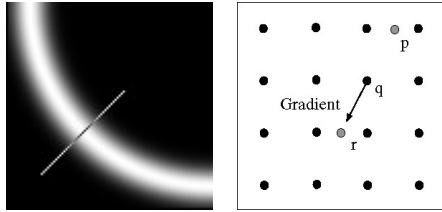

Threshold at minimum level
Get orientation

$\theta = \text{atan2}(g_y, g_x)$

Source: James Hays

Non-maximum suppression

Check if pixel is local maximum along gradient direction, select single max across width of the edge

- requires checking interpolated pixels p and r

The Canny edge detector

Problem: pixels along this edge didn't survive the thresholding

thinning
(non-maximum suppression)

Hysteresis thresholding

- Threshold at low/high levels to get weak/strong edge pixels
- Do connected components, starting from strong edge pixels

Credit: James Hays

Hysteresis thresholding

- Use a high threshold to start edge curves, and a low threshold to continue them.

Source: Steve Seltz

Recap: Canny edge detector

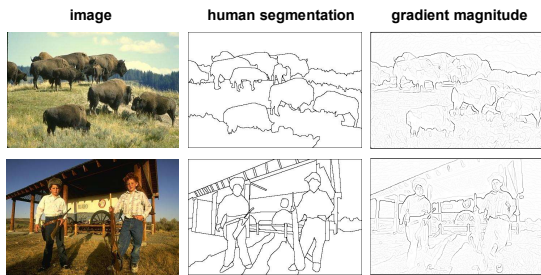

- Filter image with derivative of Gaussian
- Find magnitude and orientation of gradient
- **Non-maximum suppression:**
 - Thin wide “ridges” down to single pixel width
- **Linking and thresholding (hysteresis):**
 - Define two thresholds: low and high
 - Use the high threshold to start edge curves and the low threshold to continue them
- MATLAB: `edge(image, 'canny');`
- `>>help edge`

Berkeley segmentation database:
<http://www.eecs.berkeley.edu/Research/Projects/CS/vision/grouping/segbench/>

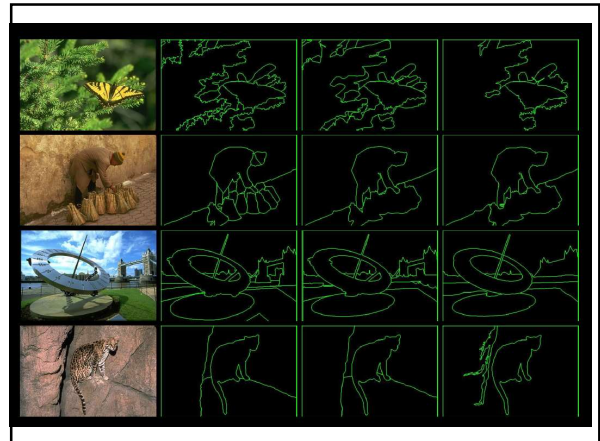

Source: L. Lazebnik

Protocol

You will be presented a photographic image. Divide the image into some number of segments, where the segments represent “things” or “parts of things” in the scene. The number of segments is up to you, as it depends on the image. Something between 2 and 30 is likely to be appropriate. It is important that all of the segments have approximately equal importance.

- Custom segmentation tool
- Subjects obtained from work-study program (UC Berkeley undergraduates)

Learn from humans which combination of features is most indicative of a "good" contour?

[D. Martin et al. PAMI 2004] Human-marked segment boundaries

Dataflow

Challenges: texture cue, cue combination
 Goal: learn the posterior probability of a boundary $P_b(x,y,\theta)$ from local information only

What features are responsible for perceived edges?

Feature profiles (oriented energy, brightness, color, and texture gradients) along the patch's horizontal diameter

[D. Martin et al. PAMI 2004] Kristen Grauman, UT Austin

What features are responsible for perceived edges?

Feature profiles (oriented energy, brightness, color, and texture gradients) along the patch's horizontal diameter

[D. Martin et al. PAMI 2004] Kristen Grauman, UT Austin

Brightness and Color Features

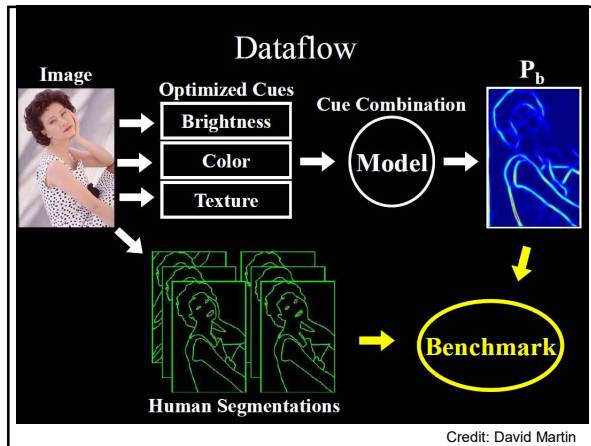

- 1976 CIE $L^*a^*b^*$ colorspace
- Brightness Gradient $BG(x,y,r,\theta)$
 - χ^2 difference in L^* distribution
- Color Gradient $CG(x,y,r,\theta)$
 - χ^2 difference in a^* and b^* distributions

$$\chi^2(g,h) = \frac{1}{2} \sum_i \frac{(g_i - h_i)^2}{g_i + h_i}$$

Cue Combination Models

- Classification Trees
 - Top-down splits to maximize entropy, error bounded
- Density Estimation
 - Adaptive bins using k-means
- Logistic Regression, 3 variants
 - Linear and quadratic terms
 - Confidence-rated generalization of AdaBoost (Schapire&Singer)
- Hierarchical Mixtures of Experts (Jordan&Jacobs)
 - Up to 8 experts, initialized top-down, fit with EM
- Support Vector Machines (`libsvm`, Chang&Lin)
 - Gaussian kernel, ν -parameterization

➤ Range over bias, complexity, parametric/non-parametric

Recall: image filtering

- Compute a function of the local neighborhood at each pixel in the image
 - Function specified by a “filter” or mask saying how to combine values from neighbors.
- Uses of filtering:
 - Enhance an image (denoise, resize, etc)
 - Extract information (texture, edges, etc)
 - Detect patterns (template matching)

Adapted from Derek Hoiem

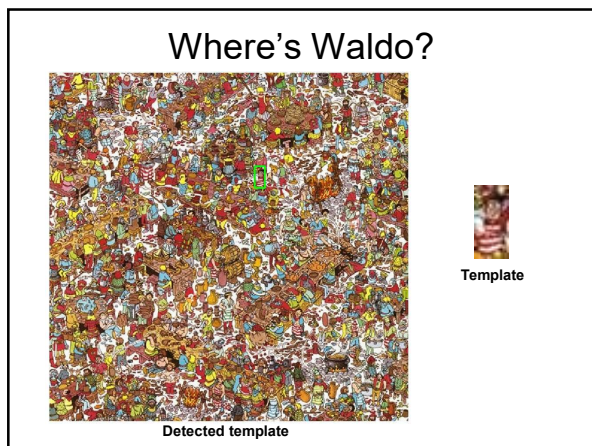

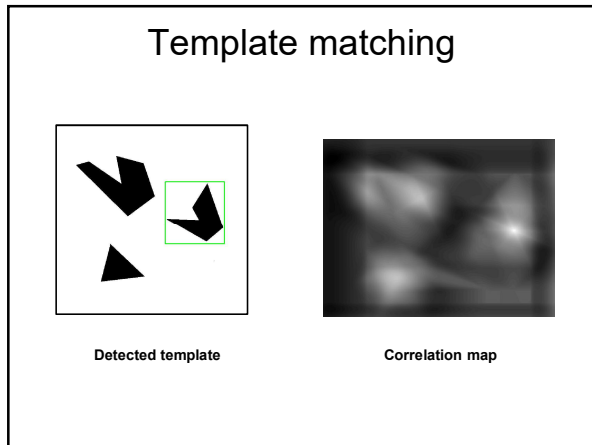

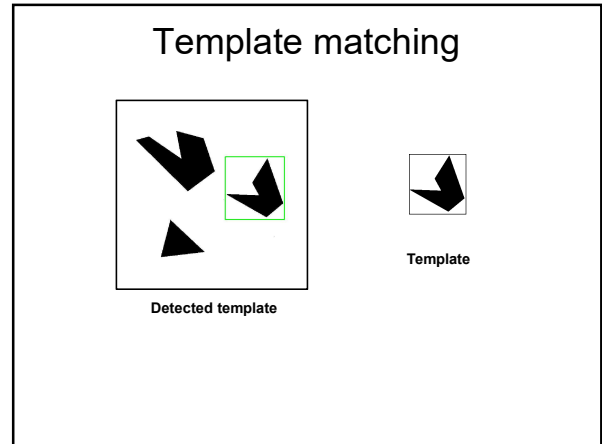

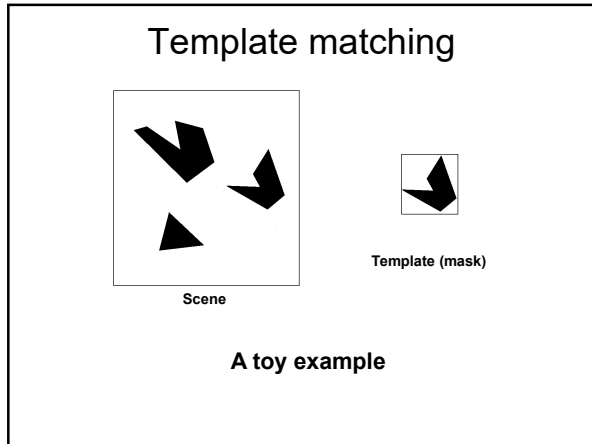

Filters for features

- Map raw pixels to an intermediate representation that will be used for subsequent processing
- Goal: reduce amount of data, discard redundancy, preserve what's useful

Template matching

- Filters as **templates**:
 - Note that filters look like the effects they are intended to find --- “matched filters”

- Use normalized cross-correlation score to find a given pattern (template) in the image.
- Normalization needed to control for relative brightnesses.

Template matching

Scene

Template

What if the template is not identical to some subimage in the scene?

Template matching

Detected template

Template

Match can be meaningful, if scale, orientation, and general appearance is right.

How to find at any scale?

Recap: Mask properties

- Smoothing
 - Values positive
 - Sum to 1 \rightarrow constant regions same as input
 - Amount of smoothing proportional to mask size
 - Remove "high-frequency" components; "low-pass" filter
- Derivatives
 - Opposite signs used to get high response in regions of high contrast
 - Sum to 0 \rightarrow no response in constant regions
 - High absolute value at points of high contrast
- Filters act as templates
 - Highest response for regions that "look the most like the filter"
 - Dot product as correlation

Summary

- Image gradients
- Seam carving – gradients as "energy"
- Gradients \rightarrow edges and contours
- Template matching
 - Image patch as a filter
 - Chamfer matching
 - Distance transform

Coming up

- A1 out tonight, due in 2 weeks
