

SUYOG DUTT JAIN PSET3 CS LOGIN: suyog

1.

This image was generated by using 16 correspondences selected manually.  $Img1$  was warped into the frame of  $Img2$  and a bounding box was generated. Then using inverse warp find the values of color for all points in the bounding box from  $Img1$  using bilinear interpolation. Then overlay  $Img2$  in the warped  $Img1$ .

2.

These are a series of pictures clicked by me at Andaman and Nicobar islands in India. I tried to create a wide angle view from these.

**After Cropping:**

After Cropping :

This has been extracted from the original uttower images given with the assignment just for the purpose of debugging my code but they give pretty good results.

3.

Putting multiple images in frames using subsequent image mosaicing.

**EXTRA CREDIT:**

**A. RANSAC:**

The visible outlier clicked very far from the actual correspondence  
Using Normal Algorithm:

**Using RANSAC:**

**The normal algorithm gives really bad results due to the outlier but RANSAC does a robust fitting by not using the outlier for calculating H matrix and hence gives good results.**
